Up to 230 000 Bq forest leaf mold contamination survey in Fukushima Prefecture

8 days, we have seen in the Contamination Investigation forest department that the concentration of radioactive cesium mulch of forest in Fukushima Prefecture (excluding the evacuation zone) in an accident Fukushima Daiichi was 232 980 becquerels per kilogram. Confirms the reality of a wide range of forest pollution.

The maximum value of the mulch was measured in the forests of North County region. Was 22 709 Becquerel average 344 Becquerel minimum. Soil up to 2975 Bq, the average minimum was not detected at 634 becquerels.

Leaves, new leaves to old leaves which came out in the year 2009-10 before the nuclear accident came 11 092 becquerel average, in the year 11-12 with 76 964 becquerel up to 32 441 Bq up to 4358 Bq average. Up to 13 093 becquerel, bark average was 1694 Bq. Air dose rate was 0.61 micro Sv on average from 0.08 to 2.61 micro Sievert per hour.

Mon 8-11 last year, the survey was conducted for softwood (cedar, pine, cypress, larch) at point 925 forest in the prefecture. Measure the total dose rate at the point of space, he also studied cesium concentration bark and leaves, mulch, bark and soil, with 90 points out of 50 points.

Study was to measure the dose rate in space nuclear accident occurred 11 years, I have to be studied in detail in addition to soil and leaves, and bark for the first time.

Countries are not subject to decontaminate non-forest life zone at the moment. I'm talking Prefectural Forest Planning Division is "I want to ask the decontamination that is integrated with forestry production activities, such as thinning. A need to expand the scope of decontamination is backed by research."
